Computer Programming 143 – Lecture 7 Program Flow Control I

Electrical and Electronic Engineering Department University of Stellenbosch

> Corné van Daalen Thinus Booysen Willie Smit Willem Jordaan

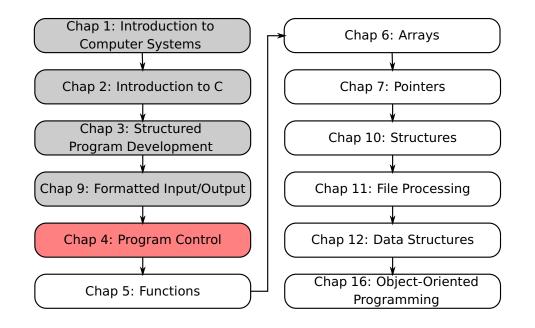

(E&E Eng. Dept. US)

CP143 Lecture 7

1 August 2016 1 / 22

Module Overview

(E&E Eng. Dept. US)

CP143 Lecture 7

1 August 2016 2 / 22

Lecture Overview

- 1 The Essentials of Repetition and Counter-Controlled Repetition (4.1-4.3)
- 2 The for Repetition Statement (4.4-4.5)
- for Examples (4.6)

4.2 The Essentials of Repetition

Loop

 A group of instructions that the computer executes repeatedly, while some condition remains true

Counter-controlled repetition

- Definite repetition: known beforehand how many times loop will execute
- Control variable used to count repetitions

Sentinel-controlled repetition

- Indefinite repetition: not known beforehand how many times loop will execute
- Sentinel value indicates "end of data"

&E Eng. Dept. US) CP143 Lecture 7 1 August 2016 3 / 22 (E&E Eng. Dept. US) CP143 Lecture 7 1 August 2016

4.3 Essentials of Counter-Controlled Repetition

Example: int counter = 1; /* initialization */ while (counter <= 10) /* repetition condition */</pre> printf("%d\n", counter); /* increment : same as counter = counter +1;*/ ++counter;

Same as: int counter = 0; /* initialization */ while (counter < 10) /* repetition condition */</pre> /* increment */ ++counter; printf("%d\n", counter);

4.3 Essentials of Counter-Controlled Repetition

The statement

```
int counter = 1;
```

- Names the variable counter
- Defines it to be an integer
- Reserves space for it in memory
- Sets it to an initial value of 1 (i.e. initialises it to 1)

4.4 The for Repetition Statement 1

for keyword control variable name final value of control variable for which condition is true for (counter = 1; counter <= 10; ++counter)</pre> increment of control initial value of variable control variable loop-continuation condition

4.4 The **for** Repetition Statement II

Format when using **for** loops

```
for ( initialization; loopContinuationTest; increment ) {
    statement;
```

Example:

```
int counter;
for( counter = 1; counter <= 10; counter++ ) {</pre>
   printf( "%d\n", counter );
```

• Prints the integers from one to ten

4.4 The for Repetition Statement III

for loops can usually be rewritten as while loops

```
initialization;
while (loopContinuationTest) {
    statement;
    increment;
}
```

for for(i = 1; i <= 10; i++) { printf("%d\n", i); }</pre>

while

```
i = 1;
while (i <= 10) {
  printf("%d\n",i);
  i++;
}</pre>
```

4.5 The for Statement : Notes II

Arithmetic expressions

• Initialisation, loop-continuation, and increment statements can contain arithmetic expressions.

```
x = 2;

y = 10;

for ( j = x; j \le 4*x*y; j += y/x )
```

• is equivalent to

```
for (j = 2; j \le 80; j += 5)
```

4.5 The for Statement : Notes I

Initialisation and incrementation

- Can be comma-separated lists
- Example:

```
for (i = 0, j = 0;  j+i <= 10;  j++, i++) {
  printf( "%d\n", j+i );
}</pre>
```

4.5 The for Statement : Notes III

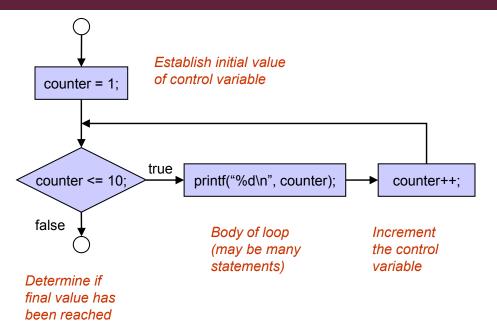

Initialisation and incrementation

- "Increment" may be negative (decrement)
- If the loop-continuation condition is initially false
 - The body of the **for** statement is not performed
 - Control proceeds with the next statement after the **for** statement
- Control variable
 - Often printed or used inside for body, but not necessary

```
int counter;
for( counter = 1; counter <= 10; counter++) {
   printf( "%d\n", counter );
}</pre>
```

EE Eng. Dept. US) CP143 Lecture 7 1 August 2016 11 / 22 (E&E Eng. Dept. US) CP143 Lecture 7 1 August 2016

4.5 The for Statement : Notes IV

4.6 for Examples I

for examples

Vary the control variable from 1 to 100 in increments of 1

• Vary the control variable from 100 to 1 in increments of -1

for
$$(i = 100; i >= 1; i--)$$

Vary the control variable from 7 to 77 in increments of 7

• Vary the control variable from 20 to 2 in increments of -2

for
$$(i = 20; i >= 2; i -= 2)$$

4.6 for Examples II

for examples (cont'd...)

• Vary the control variable from 1 to 100 in increments of 1

for
$$(i = 1; i < 101; i++)$$

• Vary the control variable from 100 to 1 in increments of -1

for
$$(i = 100; i > 0; i--)$$

• Vary the control variable over the following sequence: 2, 5, 8, 11, 14, 17.

• Vary the control variable over the following sequence: 44, 33, 22, 11, 0.

for
$$(i = 44; i >= 0; i -= 11)$$

4.6 for Design Example: Compound Interest I

for Problem statement

A person invests R1000.00 in a savings account yielding 5% interest annually. Assuming that all interest is left on deposit in the account, calculate and print the amount of money in the account at the end of each year for 10 years. Use the following formula for determining these amounts:

$$a=p(1+r)^n,$$

where

p is the original amount invested (the principal)

r is the annual interest rate

n is the number of years

a is the amount on deposit at the end of the nth year

4.6 for Design Example: Compound Interest II

4.6 for Design Example: Compound Interest III

Pseudocode

Initialise principal to 1000 Initialise interest rate to 0.05

For years 1 to 10 in increments of 1 Calculate investment amount at the end of the year Display the year and investment amount

```
C code
/* Copied from Fig. 4.6 in Deitel&Deitel
* Calculating compound interest */
#include <stdio.h>
#include <math.h>
// Function main begins program execution
int main( void )
                  // amount on deposit
   double amount;
  double principal = 1000.0; // starting principal
   double rate = 0.05;
                            // annual interest rate
   int year;
                             // year counter
  printf( "%4s%21s\n", "Year", "Amount on deposit" ); // column head
```

4.6 for Design Example: Compound Interest IV

```
C code (cont'd...)
   for ( year = 1; year <= 10; year++ ) {</pre>
      // calculate investment amount for specified year
      amount = principal * pow( 1.0 + rate, year );
      printf( "%4d%21.2f\n", year, amount ); // output one table row
   } // end for
   return 0; // indicates program ended successfully
} // end main
```

4.6 for Design Example: Compound Interest V

```
Output
        Amount on deposit
Year
  1
                  1050.00
                  1102.50
                  1157.63
                  1215.51
                  1276.28
                  1340.10
                  1407.10
                  1477.46
                  1551.33
  10
                  1628.89
```

Today

Program Control I

- Review of repetition structures
- for statement
- for examples

Next lecture

Program Control II

• do...while statement

- Study Sections 4.1-4.6 in Deitel & Deitel
- ② Do Self Review Exercises 4.3, 4.4(a),(b)&(d) in Deitel & Deitel
- **1** Do Exercises 4.5(a),(d),(e)&(g), 4.7, 4.11, 4.16 in Deitel & Deitel
